cnMaestro X Assurance (AI Analytics)

What is the issue?

When did it occur?

Why did it happen?

How can it be fixed?

Cause
RF medium may be congested or client may be moved to another Access Point after sending authentication frame to this Access Point or may be some issue with the client state machine issue, AP didn't receive the Assoc Request frame.

Resolution
Investigate potential sources of interference in the surrounding area. Ensure client drivers are updated to latest versions available.

Long-Range Outdoor Wi-Fi

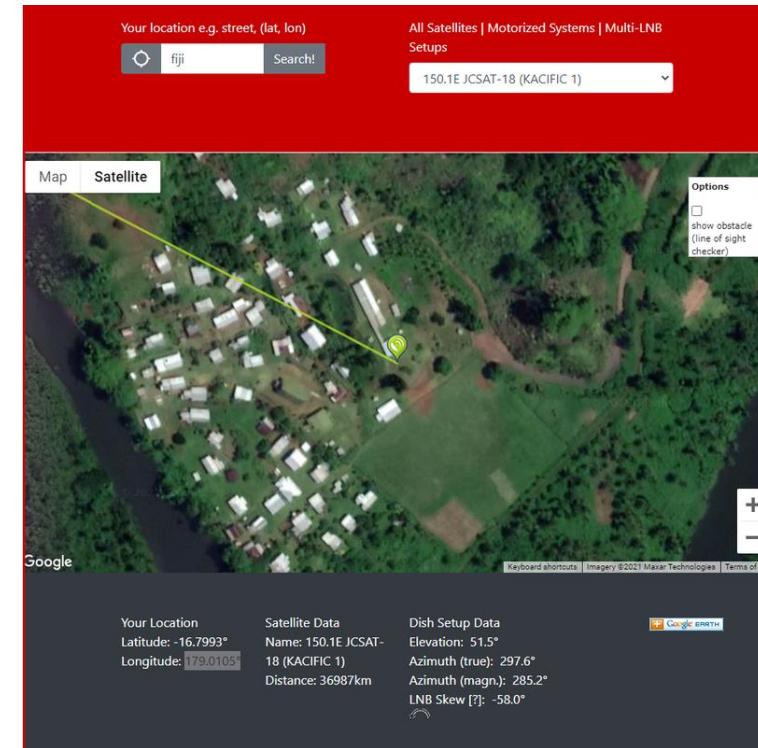

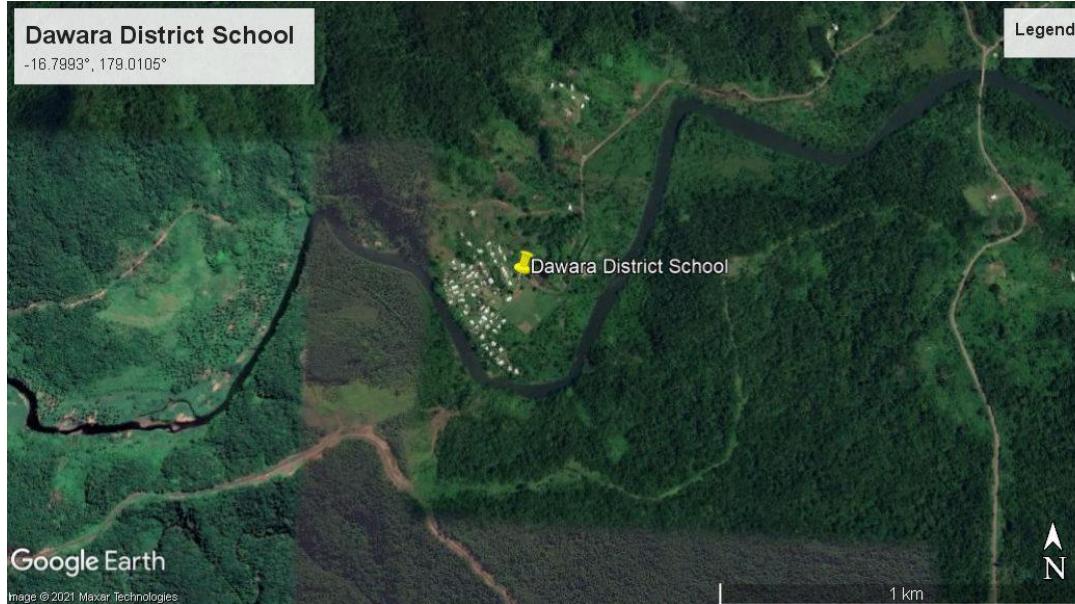

- **XV2-2T**
- **Highlights:**
 - Innovative high-gain antennas
 - Integrated omni (XV2-2T0) or 120° (XV2-2T1) antennas
 - Superior range to 1+ km
 - 2X–3X reach of conventional solutions reducing equipment by 70% or more

DUAL STARLINK SETUP USING CAMBIUM ONE NETWORK

Vodafone Fiji – 26 Remote Schools and Clinics – Wi-Fi and Satellite by Kacific

Enterprise Customer Examples

ENTERPRISE / GOVERNMENT

HOSPITALITY

EDUCATION

TRANSPORTATION / VENUES

Government education system in South Africa
with ~1M students in 1300 schools

REQUIREMENTS

- Robust connectivity for both in-class and online learning
- Support for multiple e-learning initiatives

SOLUTION

- Over 27,000 APs across 1000 schools and continuing to deploy
- Transitioned from Wi-Fi 5 to Wi-Fi 6 in 2022
- Cloud management

WHY CAMBIUM

- Scalable and flexible management
- Differentiated high density solution

Northwest Missouri State University

7,000 student university with 135 undergrad
and 36 graduate degree programs

REQUIREMENTS

- No central controllers for no single point of failure
- Reliable wireless across campus – classrooms, dorms, office spaces, sports arena, library

SOLUTION

- 2500+ APs and High Density APs covering 90% of campus across 50+ buildings, including 1300+ APs in dorms
- XMS-Cloud management
- 11,000 unique devices and 5000+ simultaneous
- Ongoing refresh to Wi-Fi 6, including XV3, XV2, XV2-22H and XV2-2T0 (outdoor)

Incheon City - Korea

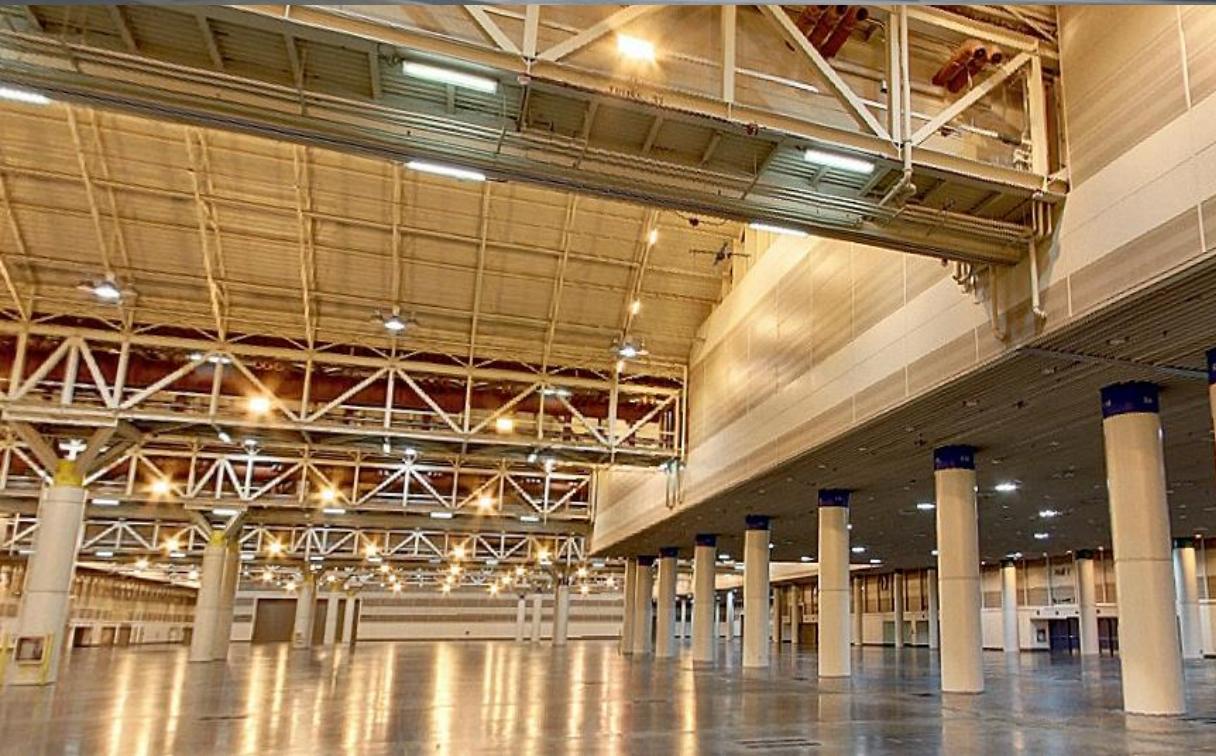

REQUIREMENTS

- Modernize Wi-Fi infrastructure to deliver greater performance and management flexibility
- Variety of use cases – offices, city hall, public spaces
- Competitive win vs. Cisco, Aruba, Ruckus

SOLUTION

- Cambium Wi-Fi 6 solution deployed across city facilities
- Mix of standard and high density APs
- Groundwork for Smart City deployment

New Orleans Convention Center

5th largest convention center in the US
3 million sq. ft with 1.1 million in exhibit space

REQUIREMENTS

- Replace aging deployment
- Keen to use 6GHz for better performance and encountering DFS issues in 5GHz (next to river)

SOLUTION

- XE5-8 and XE3-4 in hallways and meeting rooms
- XE3-4TN with directional antennas in exhibit halls
- cnMaestro X on-prem management

Britain's Premier Horse Racing Tracks

THE JOCKEY CLUB
Since 1750

• REQUIREMENTS

- Wireless coverage across 8 large race courses – up to 350 acres, up to 200,000 people capacity
- Mission critical Wi-Fi with sports books doing millions of pounds of business annually over the network
- Support spectators sharing experiences and accessing services

• SOLUTION

- 1200 standard and high density Cambium APs
- 6 years XMS-Cloud for monitoring and management
- Application Control

Australian Turf Club

Premier thoroughbred racing and hospitality venues in Sydney, Australia

REQUIREMENTS

- Deploy Wi-Fi 6 in new spectator stand with full equipment refresh planned in 2022
- High density deployments indoor/outdoor
- Wi-Fi coverage for outdoor areas, stadium seating, hospitality suites, and general use areas

SOLUTION

- 300 standard and high density APs across site
- Wi-Fi 6 deployed in new stand – high density XV3-8, outdoor XV2-2T, multi-GigE EX2016M-P switches
- XMS-Cloud managed

Melbourne Convention and Exhibition Centre

 Cambium Networks™

Australia's most versatile convention facility

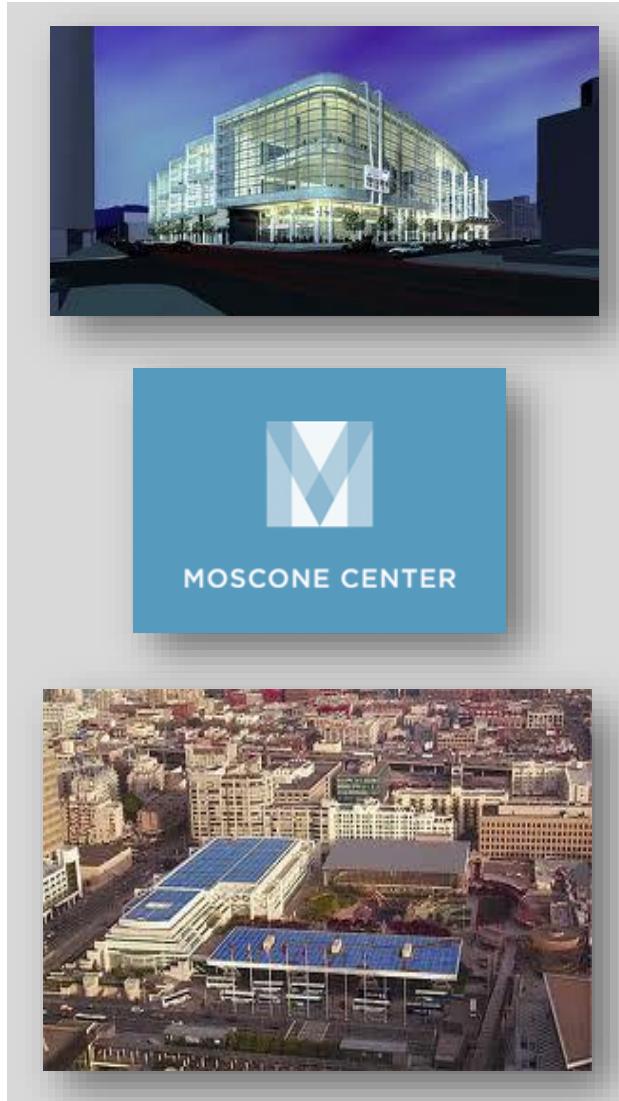

- **REQUIREMENTS**

- High density usage accommodating thousands of users at a time
- Easy deployment and manageability

- **SOLUTION**

- Nearly 300 Cambium high density APs – 3 and 4 radio, Wi-Fi 5 and Wi-Fi 6
- Tested Cambium Wi-Fi 6 AP at 2.4Gbps throughput as part of evaluation
- Managed from XMS-Cloud
- Won vs. Cisco/Meraki based on proven performance and ease of management

Moscone Convention Center

Largest convention complex in San Francisco

- **REQUIREMENTS**

- Wireless coverage across 2 million sq ft (106 meeting rooms + 4 exhibit halls)
- Reliable wireless access for dense user & device populations
- Highly reliable and secure environment

- **SOLUTION**

- Over 375 High Density APs plus portable APs used to augment large sessions
- Simultaneous Wi-Fi connectivity for up to 20,000 devices
- Xirrus Management System managing the network

Microsoft Events

Worldwide events team hosting dozens of events and 100,000's of attendees each year

“We've increased our capacity and solved a problem that we've never been able to solve and we've been able to do all the other wireless needs at the event at somewhere under half of the cost for the facility side of things as we have in the past.

JOHN O'GARA

Group Manager for Microsoft's CMG Events & Studies

REQUIREMENTS

- Simultaneously connect 10,000s of Wi-Fi users
- Temporary deployment minimizing amount of equipment
- Simple network that can be centrally managed

SOLUTION

- High performance High Density APs
- 80% less equipment and 80% less time to deploy

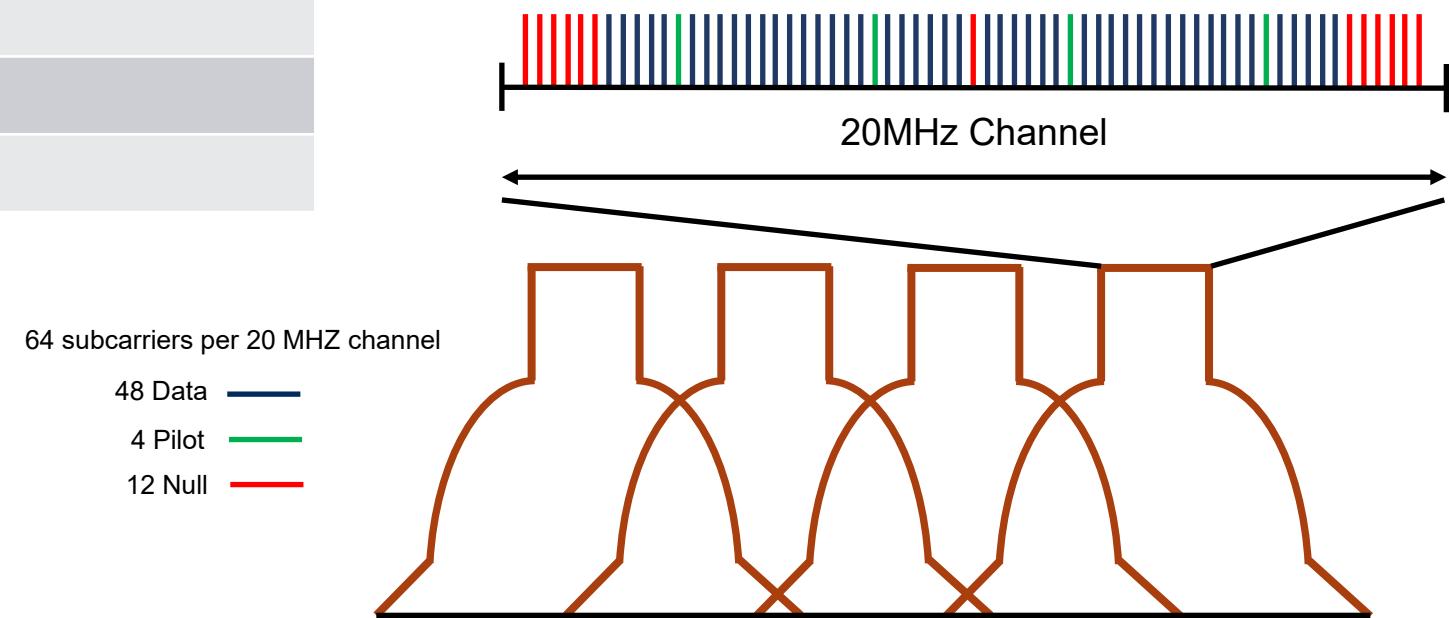

Cambium Networks™

Fundamentals of RF
Bands and Channels

Bands and Channels

| Band | Referred As | Channels |
|--------|-------------|------------------------|
| 2.4GHz | ISM | 13 Channels (3 usable) |
| 5GHz | U-NII-1 | 4 |
| 5GHz | U-NII-2A | 4 |
| 5GHz | U-NII-2C | 12 |
| 5GHz | U-NII-3 | 5 |
| 6GHz | U-NII-5-8 | 59 |

Wi-Fi channels operate in unlicensed wireless bands

Cambium Networks™

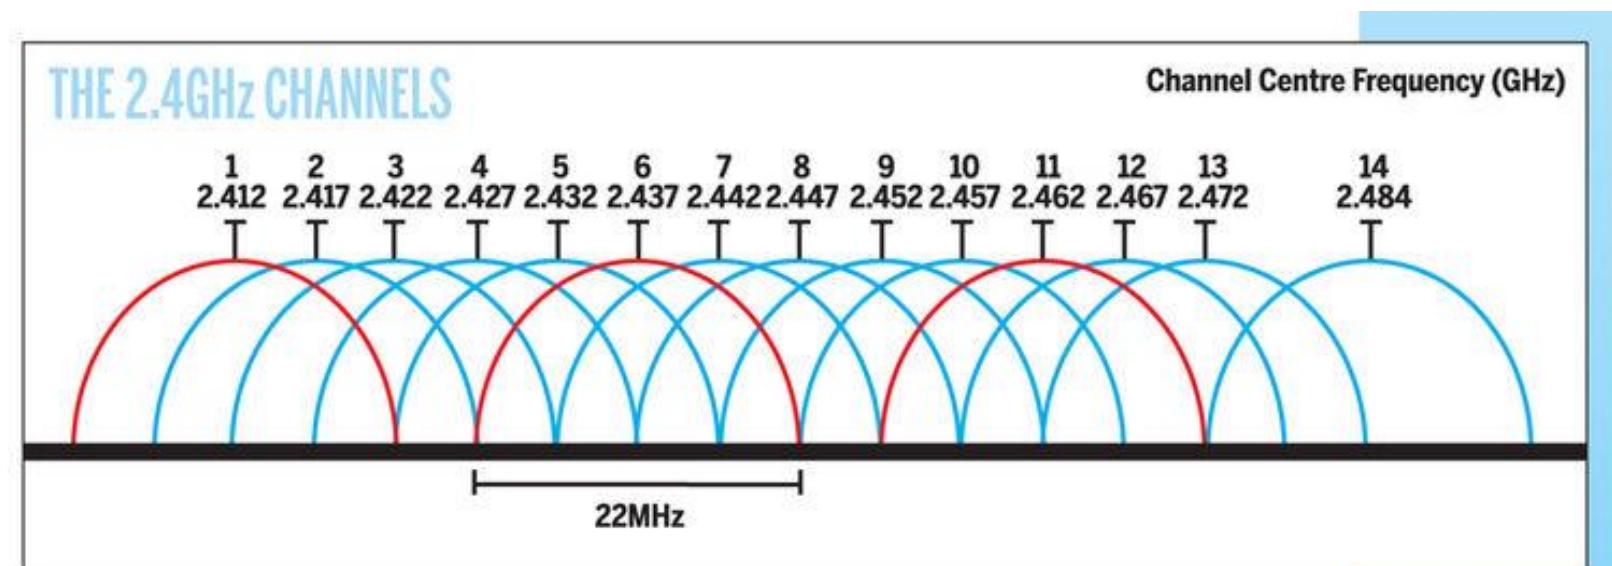

**Fundamentals of RF
Spectrum**

2.4GHz / 5Ghz / 6Ghz Band

2.4GHz Band

2.4GHz – used by 802.11b/g/n/ax clients

- 3 non-overlapping channels – 1, 6, 11 (differs by geo region)
- Limited bandwidth
- Prone to interference
 - Microwave ovens
 - Baby monitors
 - Bluetooth devices

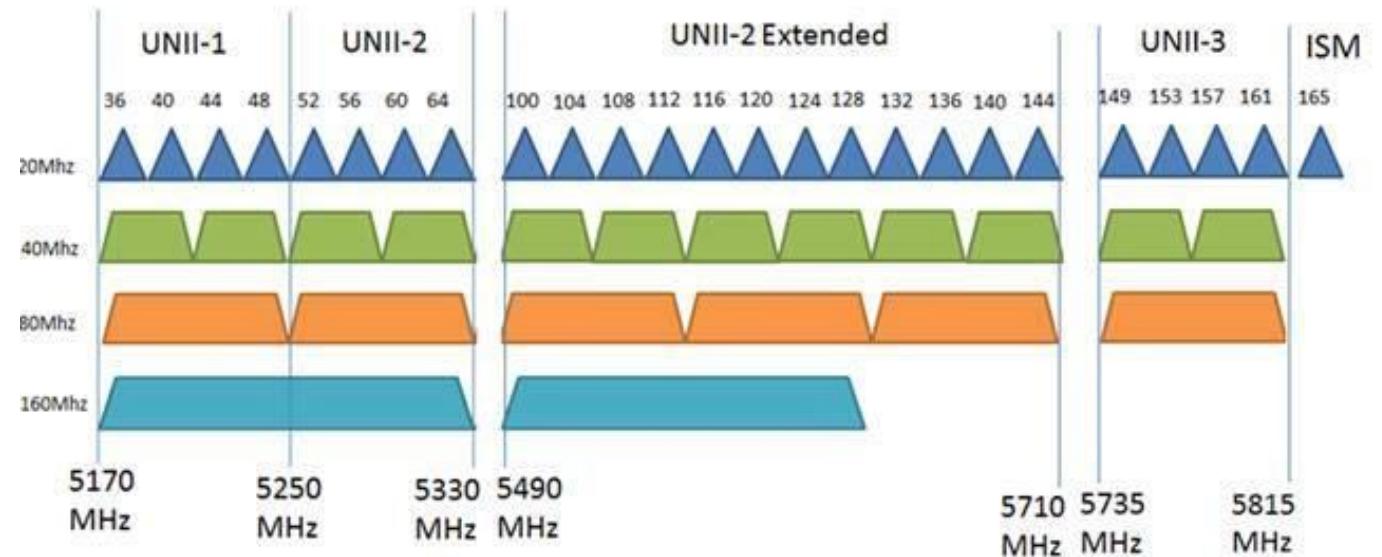

The 2.4GHz channels contain a vast amount of overlap, which is why some routers only allow you to choose from channels 1, 6 and 11. The use of channel 14 isn't permitted in the UK.

5GHz Band

25 Channels – used by 802.11a/n/ac/ax clients

- UNII 1 - 4 Channels – 36, 40, 44, 48
- UNII 2 (U-NII-2A) – 4 Channels – 52, 56, 60, 64
- UNII 2 Extended (U-NII-2C) – 12 Channels – 100, 104, 108, 112, 116, 120, 124, 128, 132, 136, 140, 144
- UNII 3 – 5 Channels – 159, 153, 157, 161, 165

- More Channels
- Less Interference
- Must support DFS

Australia DFS - Channels

5 GHz Channel Allocations

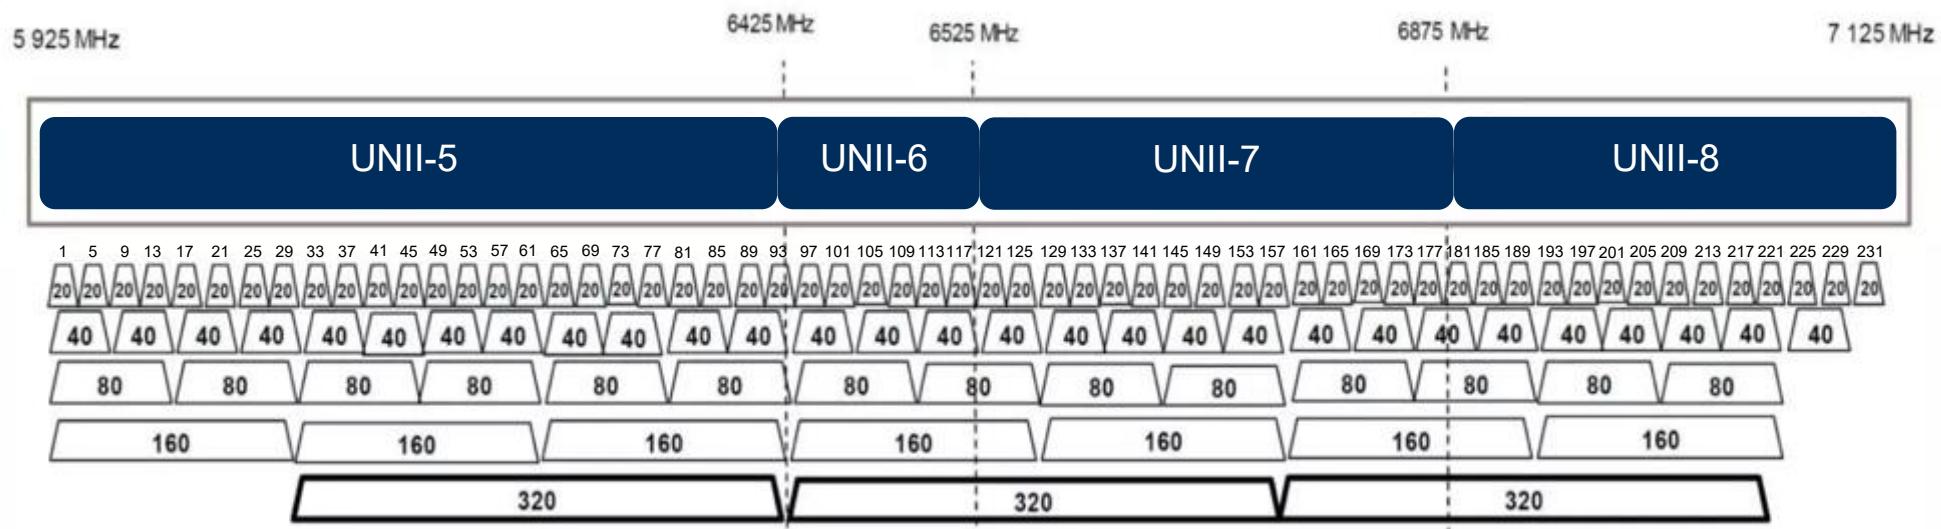

| Frequency (GHz) | 5.150 | | | | 5.250 | | | | 5.470 | | | | | | | | | | | | 5.600 | | | | 5.640 | | | | 5.725 | | | | 5.850 | | | |
|--------------------|--|------|------|------|---|------|------|------|---|------|------|------|---|------|------|------|---|------|------|------|-------|------|------|------|-------|------|--|--|--------|--|--|--|-------|--|--|--|
| 802.11 Allocations | UNII-1 | | | | UNII-2a | | | | UNII-2c (Extended) | | | | | | | | | | | | TDWR | | | | | | | | UNII-3 | | | | | | | |
| Center Frequency | 5180 | 5200 | 5220 | 5240 | 5260 | 5280 | 5300 | 5320 | 5500 | 5520 | 5540 | 5560 | 5580 | 5600 | 5620 | 5640 | 5660 | 5680 | 5700 | 5720 | 5745 | 5765 | 5785 | 5805 | 5825 | 5850 | | | | | | | | | | |
| 20 MHz | 36 | 40 | 44 | 48 | 52 | 56 | 60 | 64 | 100 | 104 | 108 | 112 | 116 | 120 | 124 | 128 | 132 | 136 | 140 | 144 | 149 | 153 | 157 | 161 | 165 | | | | | | | | | | | |
| 40 MHz | 38 | | 46 | | 54 | | 62 | | 102 | | 110 | | 118 | | 126 | | 134 | | 142 | | | 151 | | 159 | | | | | | | | | | | | |
| 80 MHz | 42 | | 58 | | 106 | | | | 122 | | | | 138 | | | | 155 | | | | | | | | | | | | | | | | | | | |
| 160 MHz | 50 | | 114 | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| FCC | 1,000 mW Tx Power Indoor & Outdoor No DFS needed | | | | 250 mw w/6dBi Indoor & Outdoor DFS Required | | | | 250mw w/6dBi Indoor & Outdoor DFS Required 144 Now Allowed | | | | 120, 124, 128 Devices Now Allowed | | | | 1,000 mW EIRP Indoor & Outdoor No DFS needed 165 was ISM, now UNII-3 | | | | | | | | | | | | | | | | | | | |
| DFS Channels | DFS Channels | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |

Wi-Fi 6E - 6GHz Clients Only!

(No backward compatibility)

- 1.2 GHz additional spectrum approved by FCC
 - UNII-5, 6, 7, 8
- 500MHz additional spectrum approved in Europe
 - UNII-5

| Channel width | # of channels |
|-----------------|---------------|
| 20MHz Channels | 59 |
| 40MHz Channels | 29 |
| 80MHz Channels | 14 |
| 160MHz Channels | 7 |

Expanded unlicensed use of the 6GHz band in the US

| Device Class | Operating Band | Max EIRP |
|---------------------------------------|----------------|----------|
| Low-power AP (indoor only) | U-NII 5,6,7,8 | 30dBm |
| Client connected to low-power AP | U-NII 5,6,7,8 | 24dBm |
| Standard-power (AFC controlled) | U-NII 5,7 | 36dBm |
| Client connected to standard-power AP | U-NII 5,7 | 30dBm |

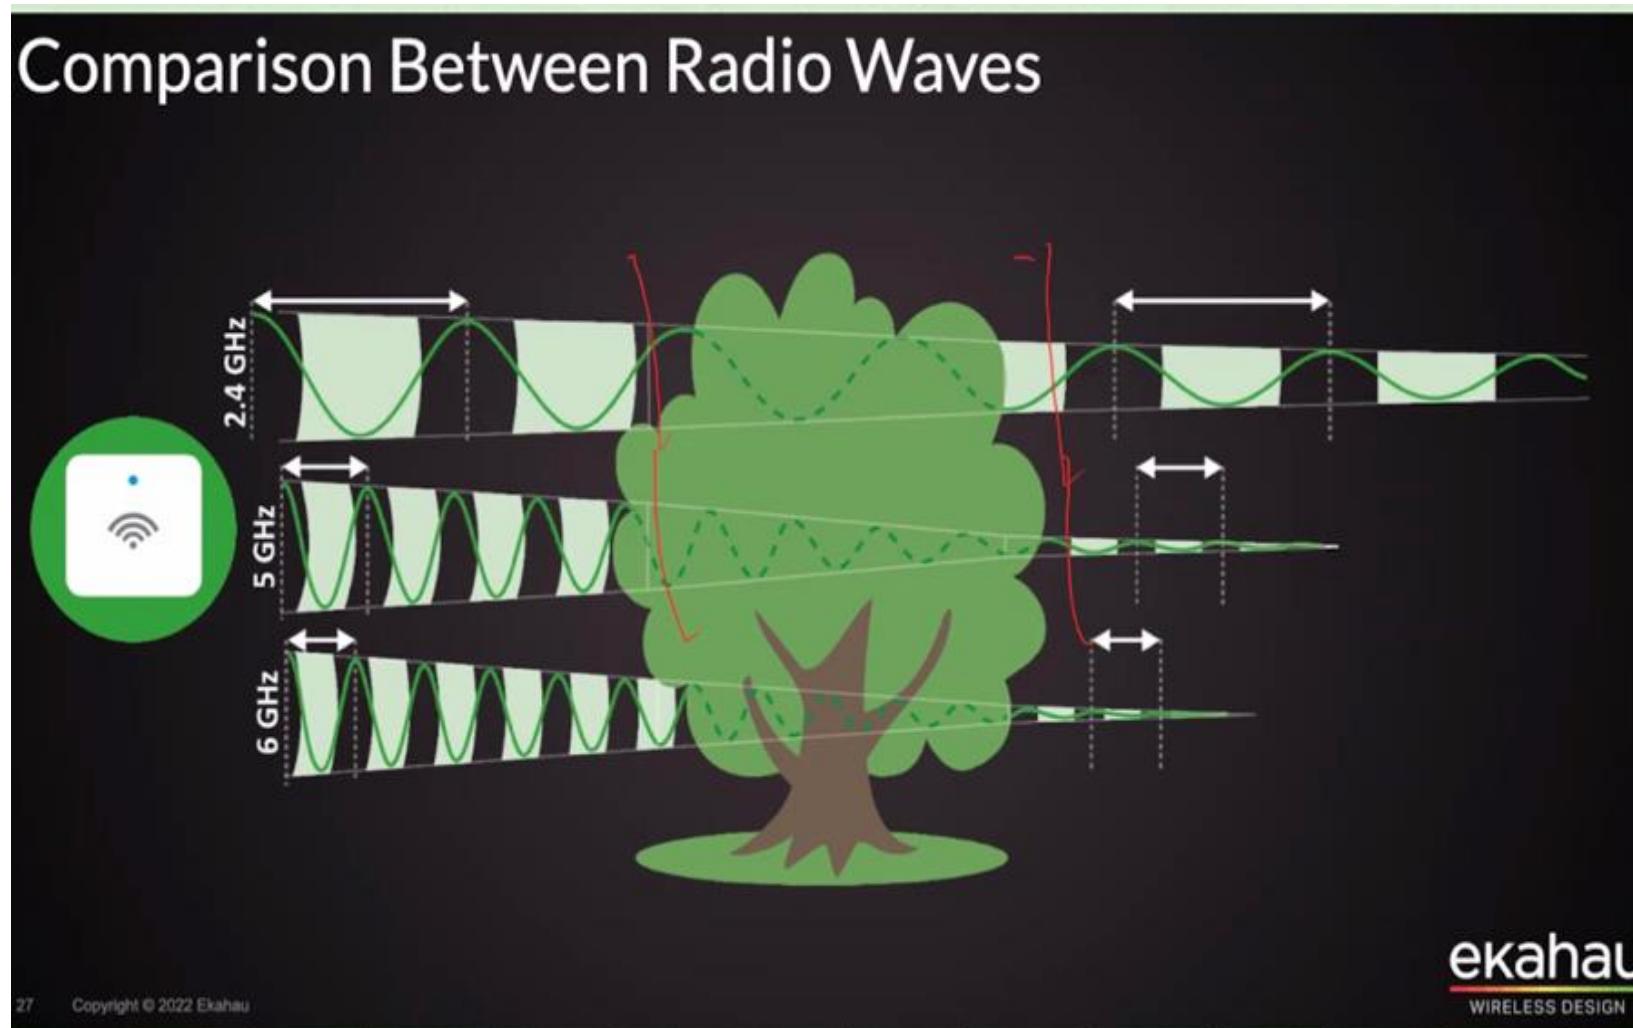

Automated Frequency Coordination (AFC)

- Protect incumbent operations from RF interference
- Required for outdoor use
- Geolocation databases to manage real-time frequency assignments

Cambium Networks™

Summary of Technical Specifications

Modulation and Techniques

| Wi-Fi Standard | OFDM | OFDMA | MIMO | Beamforming | TDD |
|--------------------|------|-------|------|-------------|-----|

| 802.11b | Yes | No | No | No | No |
| 802.11g | Yes | No | No | No | No |
| 802.11n | Yes | No | Yes | Yes | Yes |
| 802.11ac | Yes | No | Yes | Yes | Yes |
| 802.11ax (Wi-Fi 6) | Yes | Yes | Yes | Yes | Yes |
| 802.11ay (Wi-Fi 7) | Yes | Yes | Yes | Yes | Yes |

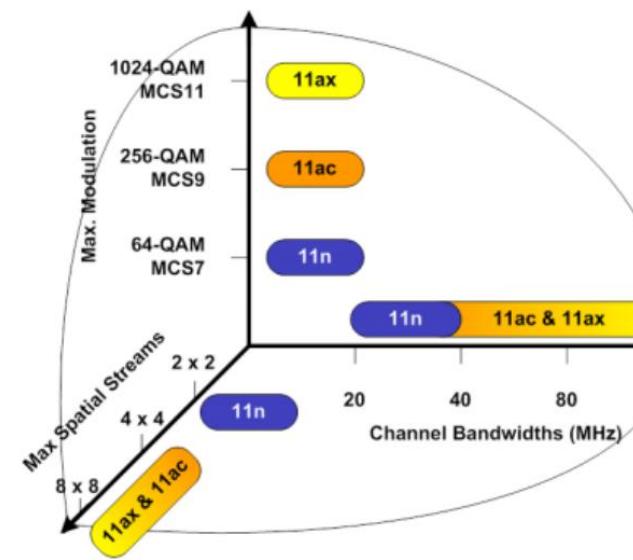

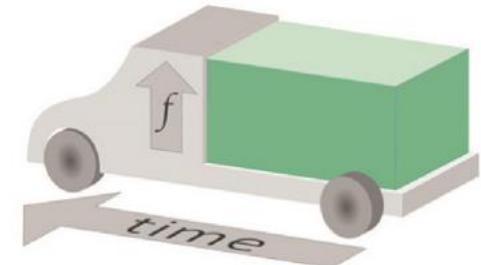

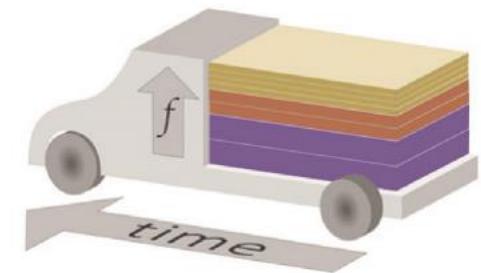

Figure 5 Evolution of Wi-Fi radio performance¹⁵

802.11ac, 40 MHz channel
One transmission

802.11ax, 40 MHz channel
Divide transmission by frequency into 242 sub-carriers in groups of 26.

Multi - Link

Alternating or simultaneous

Choice of Links

Between router and client
2.4 GHz or 5 GHz

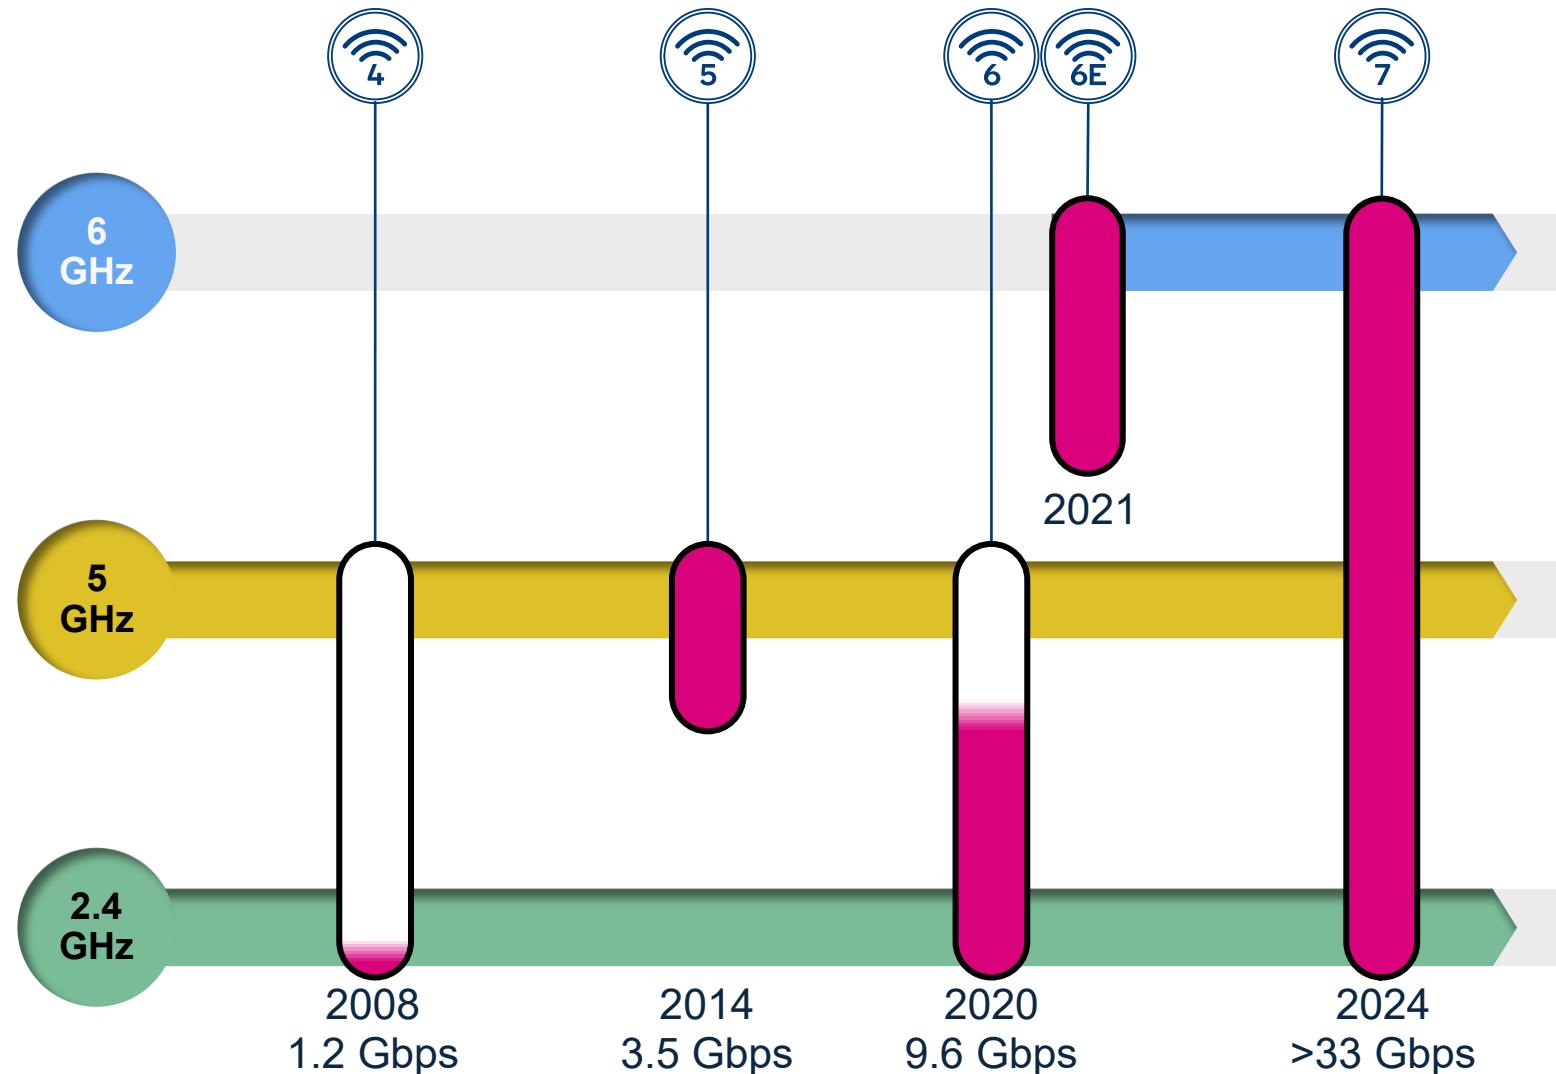

One Link

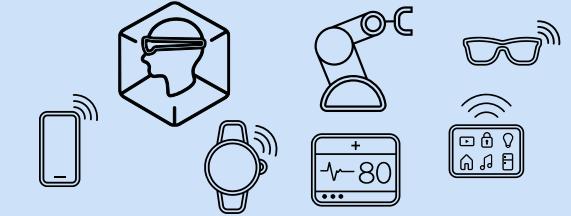

Between router and client

Faster Wi-Fi, More devices, Lower Latency

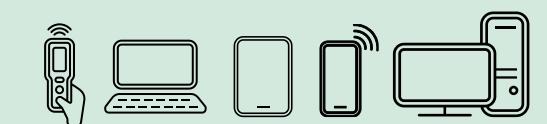

AR/VR, AI applications, IOT

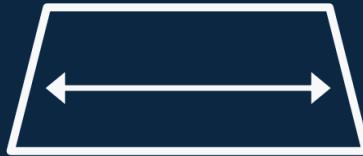

Streaming video/audio
All wireless office, LPV

Smartphones, Tablets
25% YoY growth 2010-2013

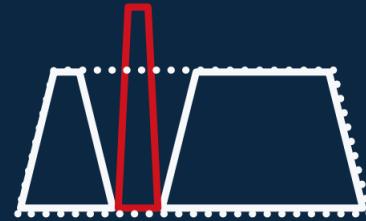

Faster Connections

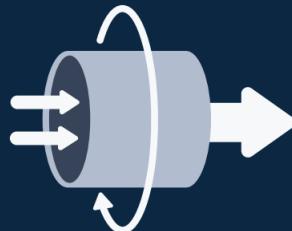

320MHz/240MHz channels & 4k QAM

Adaptive Connections

Adaptive Interference Puncturing

Multiple Connections

Wi-Fi Multi-Link Operation

High Band Simultaneous Multi-Link

Key Concepts that Drive Wi-Fi 6E and 7 adoption and deployment decisions

Wi-Fi must keep pace with client devices

- New features require client support, some new features are proprietary e.g., Qualcomm HBS Multilink
- 96% of AR/VR/Spatial Computing will ship with Wi-Fi 6E/7

6 GHz operation is the key to massive speed

- Not all countries support 6 GHz, but many do
- Most countries use similar rules for indoor 6 GHz

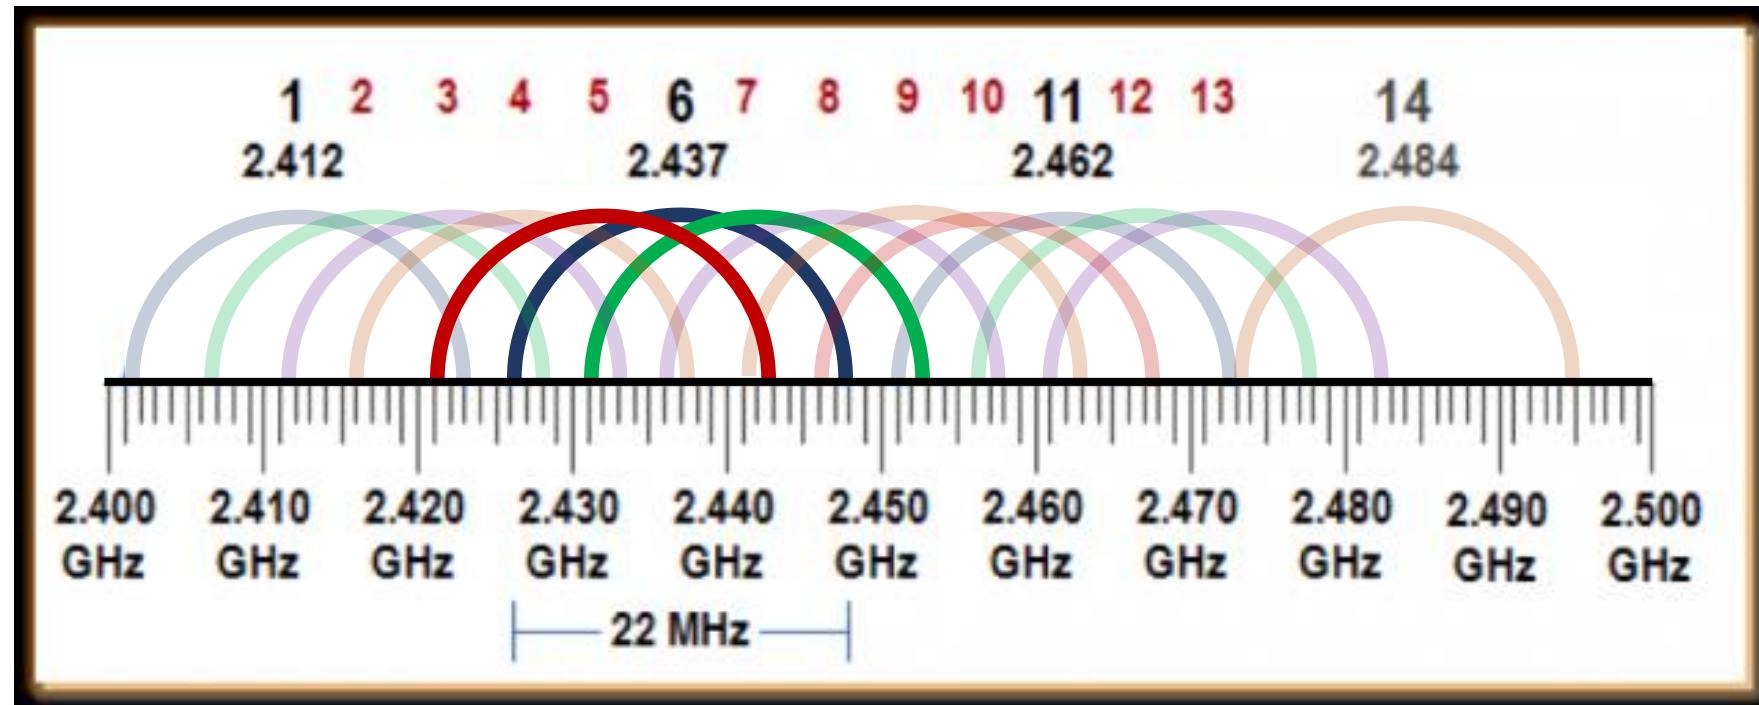

Cambium Networks™

Channel Interference

Channel Interference

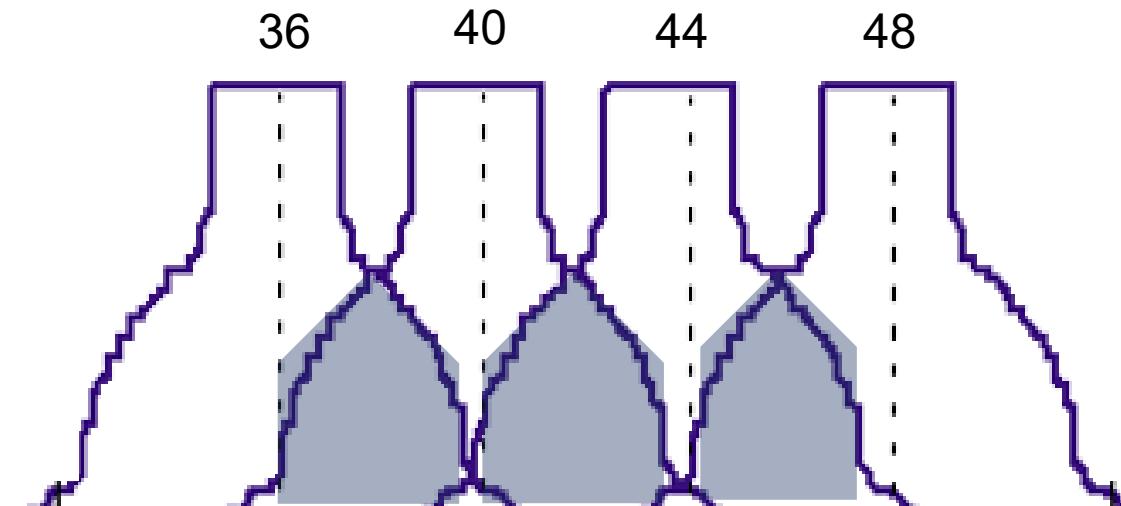

Adjacent Channel Interference – 2.4GHz

- Previous or next channel number (ie. 5,6,7)
- Insufficient channel separation causes interference from neighboring channels

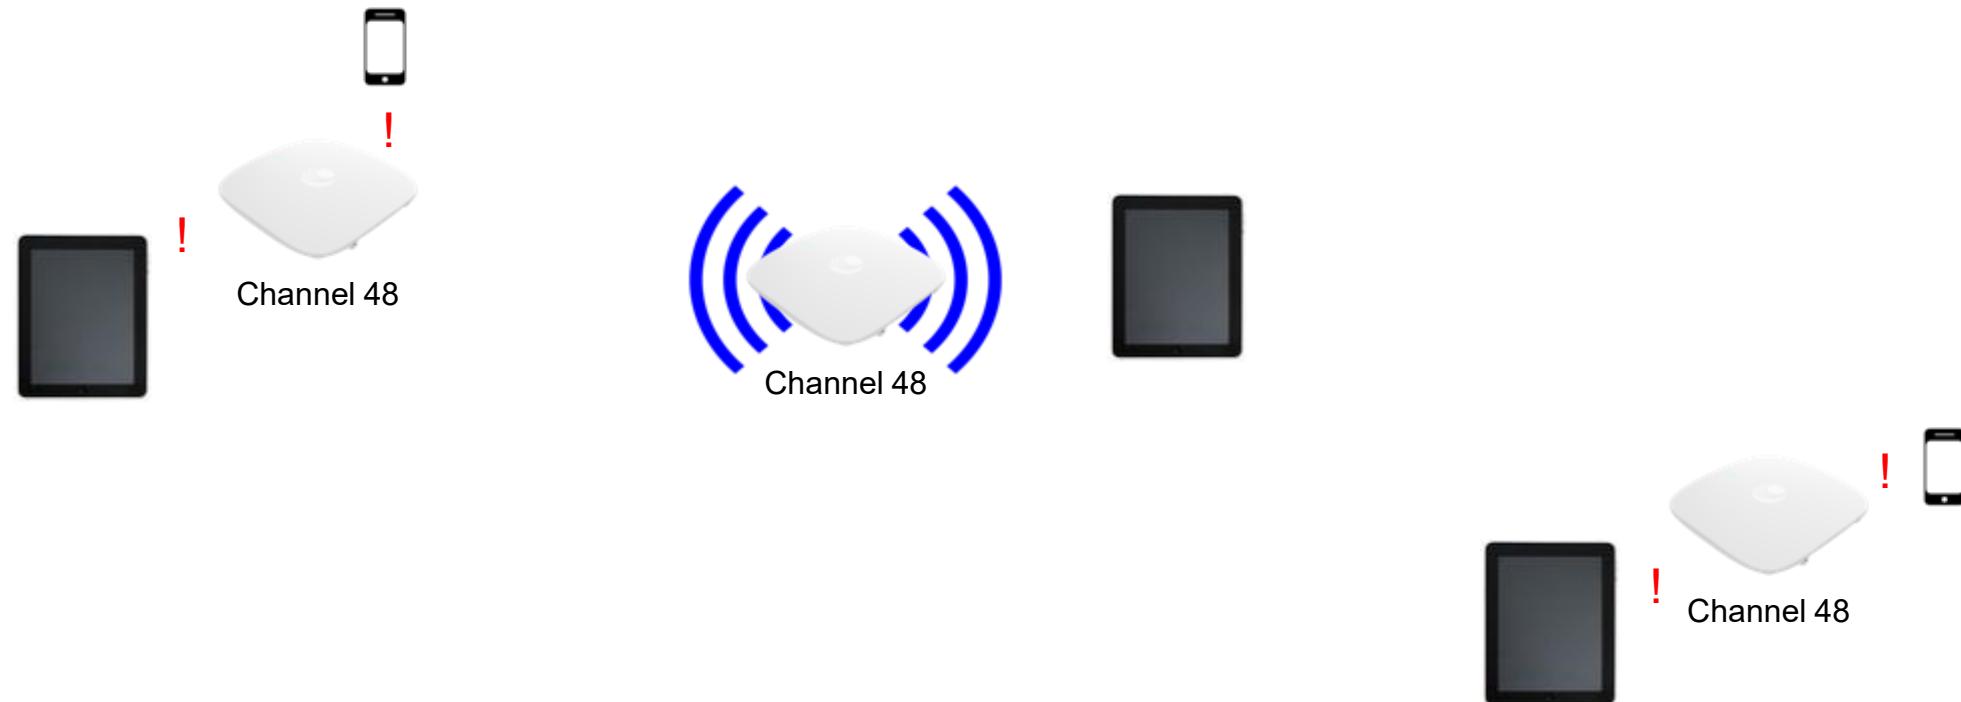

Adjacent Channel Interference – 5GHz

- Previous or next channel number (ie. 36,40,44)
- Even though the 5GHz channels have separation built into them, it is possible to get a little interference from the side bands

Co-Channel Interference

- 2 or more APs within range of each other share same channel
- Only 1 device allowed to transmit at a time, others wait their turn

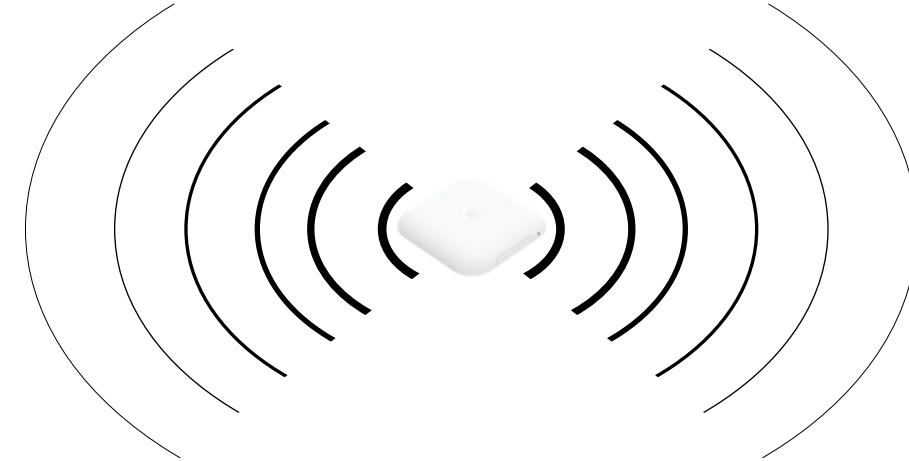

Behaviors - Inhibitors

- Wave propagation
- Propagation loss

Range Inhibitors

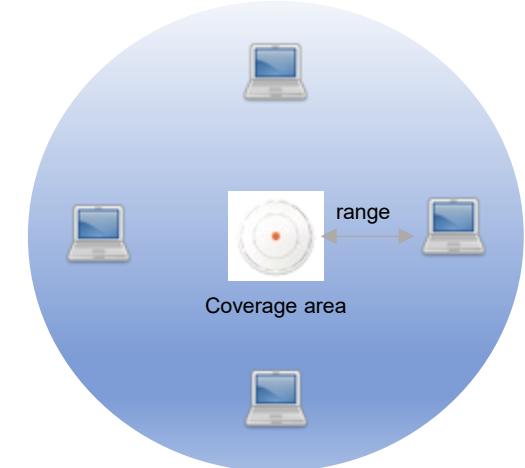

- Multi-path
- Interference
- Attenuation

| Element | Materials/Physical Elements | Impact on WiFi Signal |
|------------------------|---|---|
| Diffraction | Walls, furniture, corners, and other obstacles | Can cause signal loss or attenuation, especially when the obstacle is comparable in size to the wavelength. |
| Reflection | Glass, metal surfaces, mirrors, and other reflective materials | Can cause signal interference or multipath fading, leading to signal degradation. |
| Absorption | Concrete, metal, water, and other absorbent materials | Can absorb significant amounts of WiFi signal, reducing its strength. |
| Scattering | Cluttered environments, irregular surfaces, and objects with complex shapes | Can cause signal attenuation and interference. |
| Fading | Moving objects, changing environmental conditions, and multipath interference | Can lead to fluctuations in signal strength. |
| Multipath Fading | Reflective surfaces, multiple paths between router and receiver | Can cause rapid fluctuations in signal strength. |
| Polarization | Metal objects, certain types of antennas | Mismatched polarization can reduce signal strength. |
| Frequency Interference | Other electronic devices operating on the same frequency band (e.g., cordless phones, microwaves) | Can cause signal degradation and reduced throughput. |

Range / Coverage / Capacity

- Transmission Basics
 - Range
 - Operating distance between two radios that wish to communicate
 - Access Point to Station
 - Station to Station
 - Coverage
 - Total area wherein radios can maintain connection to Access Point
 - Range vs. Capacity - The greater the coverage area...
 - ...the more wireless stations can be covered
 - ...the less bandwidth available to each user
 - ...the lower data rates will be at the edge
 - ...the more likely the chances of “hidden nodes”

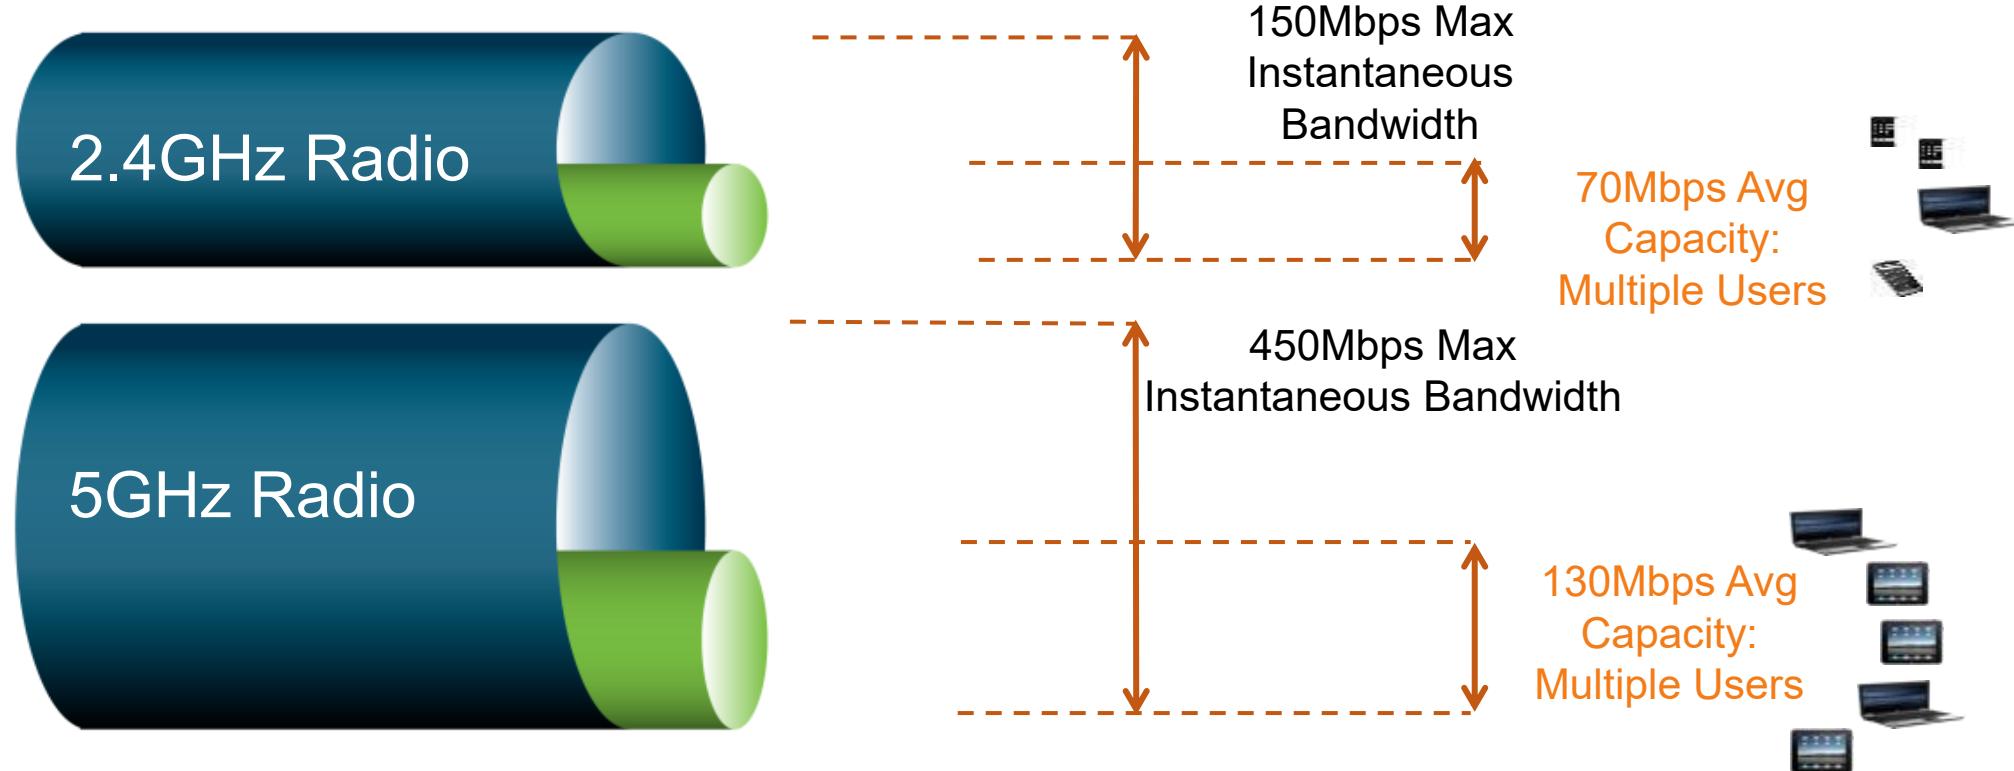

Cambium Networks™

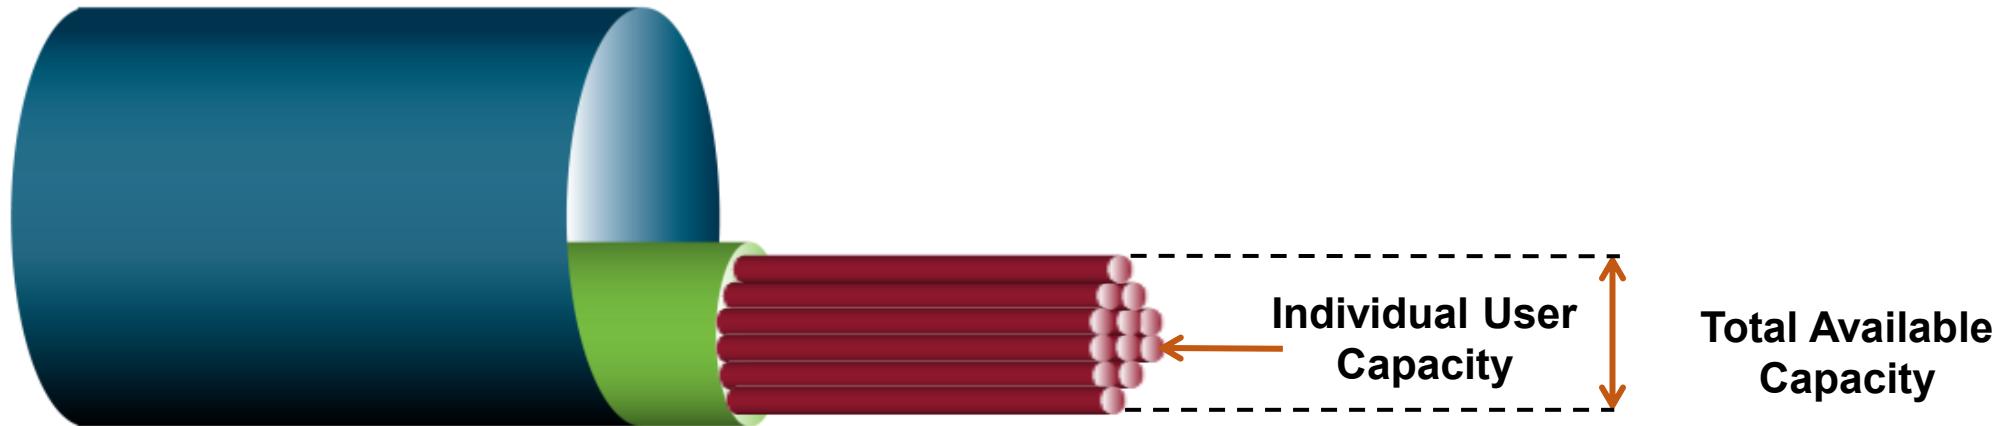

Bandwidth / Clients

Understanding Radio Capacity

In a Wi-Fi network, radio capacity is reduced by **half duplex transmissions, protocol overhead and is shared by multiple users**

Understanding Radio Capacity

5GHz radio: $450\text{Mbps} / 20\text{Mbps} = \text{\~{}22 users per radio}$

2.4GHz radio: $150\text{Mbps} / 20\text{Mbps} = \text{\~{}7 users per radio}$

Devices Per AP

Public Wi-Fi – General Usage (~5 Mbps/device)

| | XE3 | XV3 | XE5 |
|----------------|-----|-----|-----|
| Devices Per AP | 100 | 200 | 400 |

Office/Classroom – Critical App Usage (~15 Mbps/device)

| | XE3 | XV3 | XE5 |
|----------------|-----|-----|-----|
| Devices Per AP | 40 | 80 | 160 |

File Transfer – High Capacity Usage (~60 Mbps/device)

| | XE3 | XV3 | XE5 |
|----------------|-----|-----|-----|
| Devices Per AP | 12 | 25 | 50 |

- These numbers factor in both capacity (varies by table) and density (varies by AP model)
- These are general guidelines, many factors to consider they may impact these:
 - Specific applications
 - Physical environment
 - RF environment
 - Client types
 - Wi-Fi bands
- These numbers are based on 5GHz radio usage specifically
 - 6GHz usage on XE models which will increase capacity
 - Does not factor in 2.4GHz radios which have lower capacity and in many cases may be disabled

Application Throughput Requirements*

| Activity | Download Speed (Mbps) | Activity | Download Speed (Mbps) |
|------------------------|-----------------------|---------------------------|-----------------------|
| General Browsing/Email | 1 | Personal Video Call Std | 1 |
| Streaming Online Radio | 0.5 | Personal Video Call HD | 1.5 |
| VoIP Calls | 0.5 | HD Video Teleconferencing | 6 |
| Student | 5 – 25 | Game Console | 3 |
| Telecommuting | 5 – 25 | Online Multiplayer | 4 |
| File Downloading | 10 | File Transfer | 100 |
| Social Media | 1 | | |
| Video Streaming Std | 3 - 4 | | |
| Video Streaming HD | 5 - 8 | | |
| Video Streaming 4K | 25 | | |

* FCC Broadband Speed Guide (www.fcc.gov/consumers/guides/broadband-speed-guide)

Throughput Requirements – Office Example

| Application | Throughput Requirement (Mbps) |
|------------------------|-------------------------------|
| Email | 1 |
| Zoom calls | 3 |
| File Downloading | 10 |
| MS Office | 5 |
| Other network traffic | 1 |
| Future growth | 25% |
| Throughput requirement | 25 |

Office Network

Aggregate Throughput

Throughput requirement * number of connected devices * oversubscription ratio

Office: $25 * 150 * 0.20 = 750\text{Mbps}$

Conf Room: $26 * 60 * 0.20 = 312\text{Mbps}$

Cambium Networks™

Wi-Fi Network Design
Best Practices

Before You Start the Design

- Business Requirements / User Requirements
- Existing WAN / LAN / WLAN
- Areas requiring wi-fi coverage
- Client Devices
 - What type (phones - 1 antenna, tablets – 2 antennas, laptops – 3 antennas)
 - How many client devices
 - Application usage
 - Bandwidth requirements
- Latency Requirements
- Signal Strength Requirements
- Coverage Requirements
- Capacity Requirements
- Security Requirements
- Roaming Requirements (Layer 2 & Layer 3)
- WIPS / MDM / NAC
- Guest Access
- Design Constraints and Restrictions

Network Design = Is Getting the Math Right

- Coverage is a given, focus on Capacity and Performance
- Design for all bands - 2.4GHz, 5GHz and 6GHz
- Determine signal criteria required based on device usage:
 - -72 dBm RSSI was 'Good Enough' for laptops
 - -65 / -62 dBm RSSI is required for Smartphone/Tablet/VoWiFi
 - Stronger RSSI values (-60) may be required for some devices, ...
- Understand the impact of device density per radio
 - High performance = <20
 - Medium performance = <40
 - Low performance = <80
- Plan coverage with all locations seeing multiple radios/APs
- Make sure the customer appreciates the need for and buys 802.11a/b/g/n/ac/ax/be enabled clients!!!

Means 5GHz!

WAN / LAN Capacity

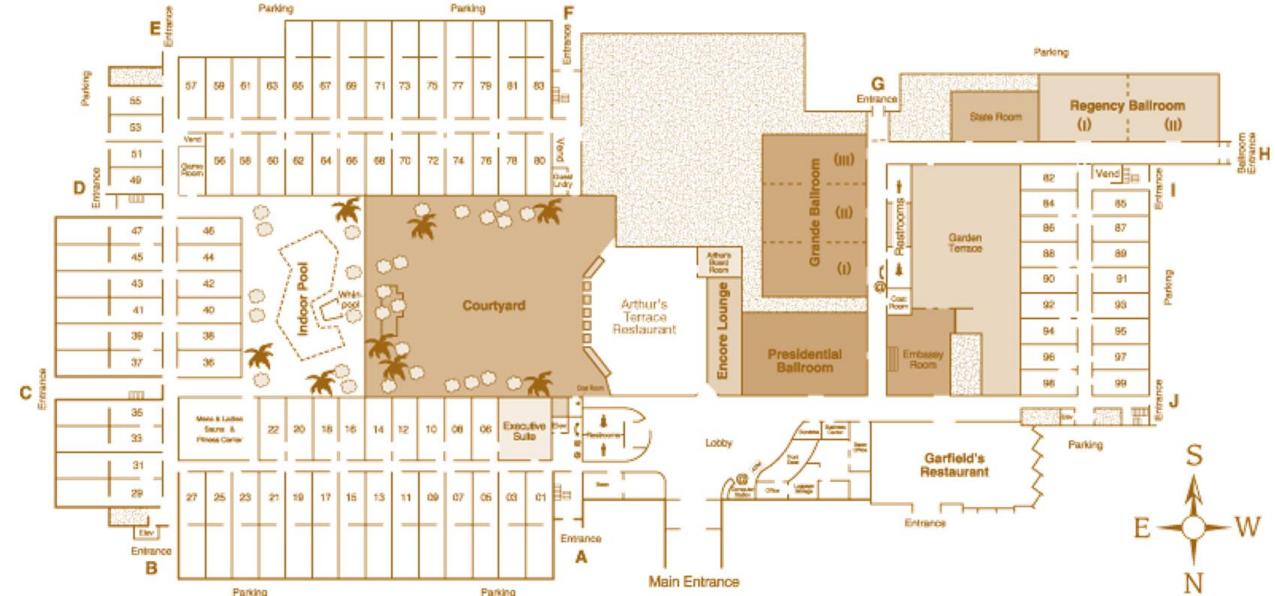

- Existing switching infrastructure
 - Available ports
 - Port speeds supported
 - PoE
 - Available PoE switch power budget
- Cable drops
 - Cable rating
 - Locations
- WAN
 - Router port speed
 - WAN connection speed
- DHCP – IP address availability
 - Existing LAN
 - WLAN infrastructure
 - WLAN clients
- One facility – multiple environments
 - Storage areas – little to no wi-fi coverage
 - Warehouse – scanners, limited client usage
 - Congested office areas – Desktops, laptops, tablets, phones, BYOD
 - Cafeteria, auditorium - Tablets, phones, BYOD

Cookie cutter designs

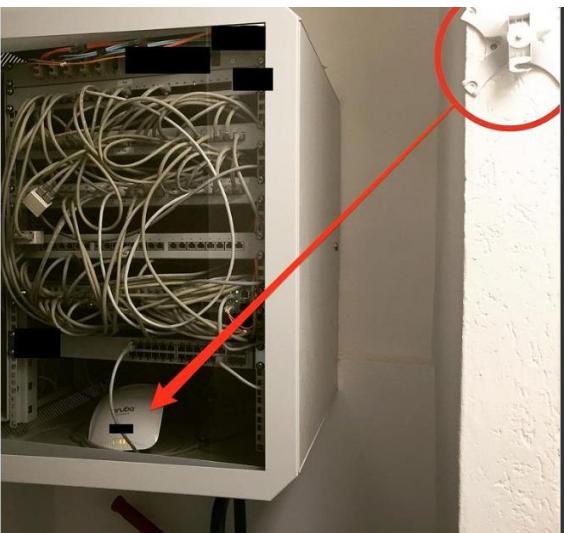

No two environments are exactly the same

Taking shortcuts rises potential for:

- Missed interferers
- Too many devices or too few devices
- Poor performance

Ugh!!!

Cambium Networks™

Number of Radios

A Network Design Checklist

Number of radios

| Enterprise | | | |
|----------------------------|------|--------|------|
| | Low | Medium | High |
| XV3, XE3, XE5 | | | |
| Mbps | 1–25 | 25–60 | 60+ |
| Clients per 5GHz 4x4 radio | 40+ | 25-40 | 1-25 |
| Clients per 6GHz 4x4 radio | | | |

Office Area

40 Clients / 26Mbps each

1,040Mbps aggregate bandwidth

Conference Room

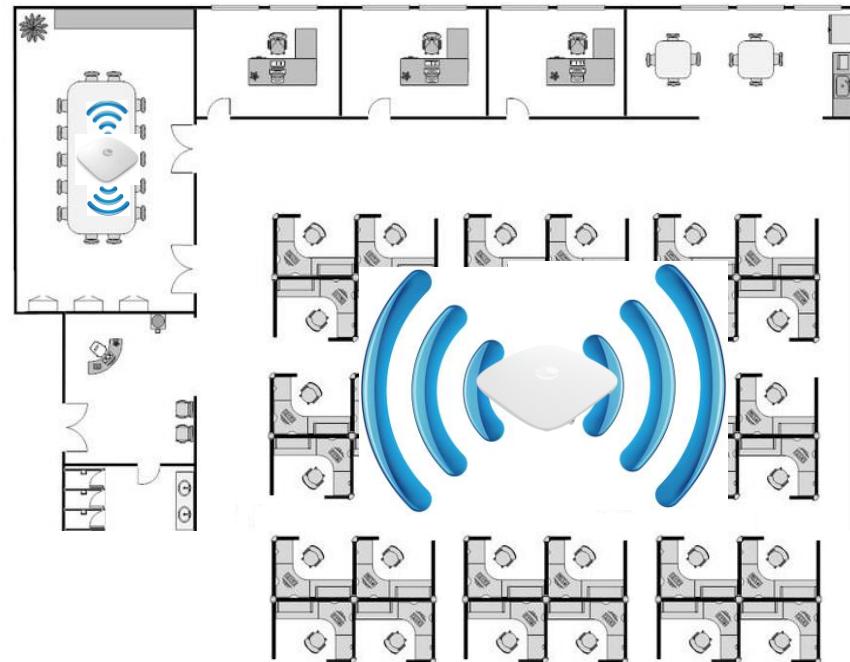

12 Clients / 26Mbps each

312Mbps aggregate bandwidth

1 – 2 radios required in office

1 radio in conference room

Office Network

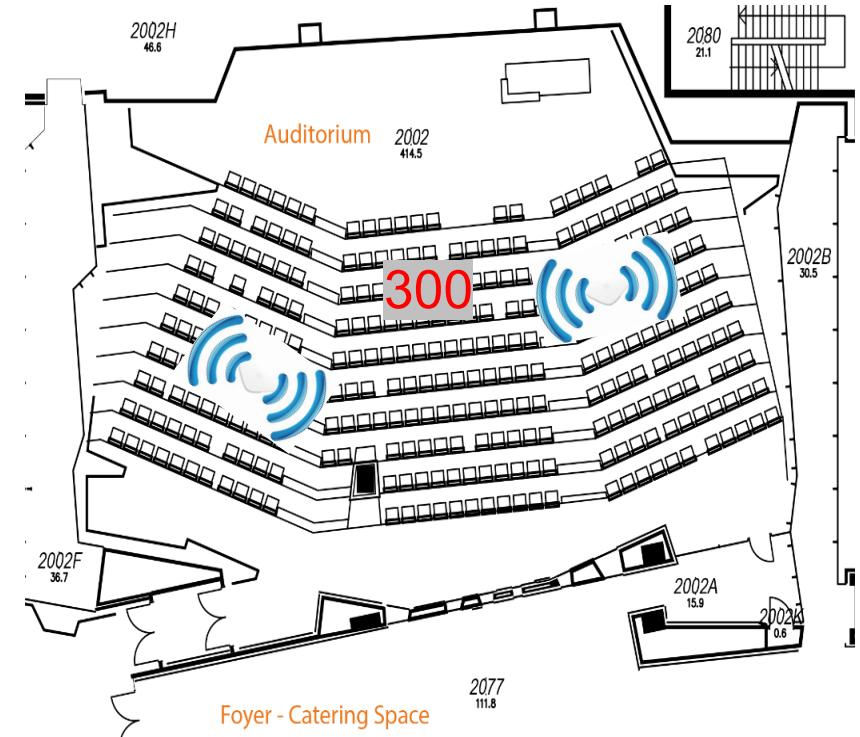

Number of radios

| | High Density | | |
|----------------------------|--------------|--------|--------|
| XV3, XE3, XE5 | Low | Medium | High |
| Mbps | 1-40 | 40-75 | 75-100 |
| Clients per 5GHz 4x4 radio | 25-50 | 15-25 | 10-15 |
| Clients per 6GHz 4x4 radio | | | |

$$\begin{aligned} 300 \text{ students} / 40 \text{ students per radio} \\ = \\ 8 - 5/6\text{Ghz radios} \end{aligned}$$

Auditorium Network

300 Clients / 20Mbps
1,500Mbps aggregate bandwidth

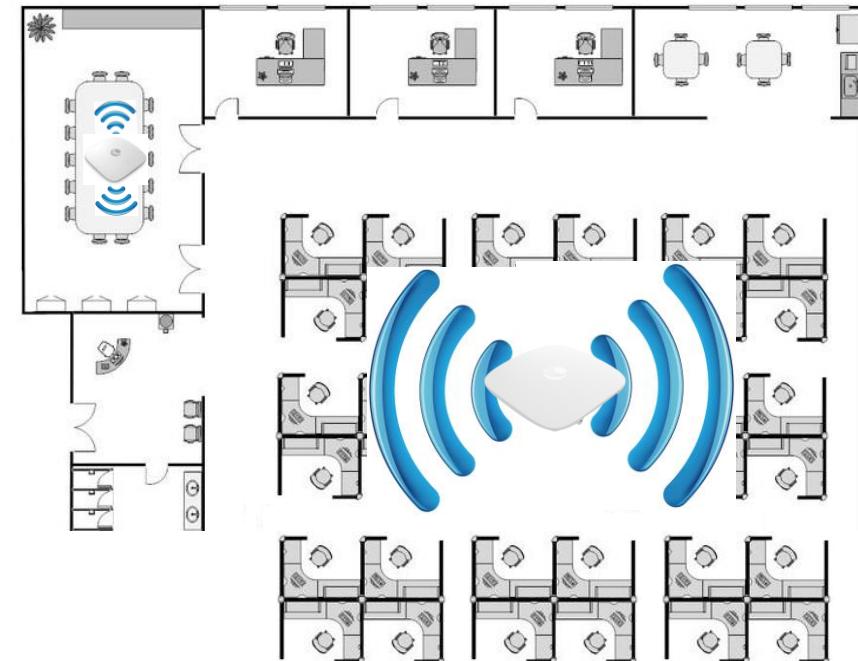

Type of Access Point

Design Office area for performance with one XE3-4

| | Number of 5GHz radios | Number of 6GHz radios |
|--------------------|-----------------------|-----------------------|
| XV2-2 | 1 | 0 |
| XV3-8 | 2 | 0 |
| XE3-4 (SDR) | 1/2 | 1 |
| XE5-8 (SDR) | 2/4 | 2 |

| | Rate with 40MHz channels 1024QAM (in Mbps) |
|---------------------------|--|
| XV2-2 5GHz (2x2) | 574 |
| XV3-8 5GHz (4x4) | 2,294 |
| XE3-4 5/6GHz (4x4) | 1,147 |
| XE3-4 5GHz (2x2) | 574 |
| XE5-8 5/6GHz (4x4) | 1,147*2 |
| XE5-8 5GHz (4x4) | 1,147*2 |

Office Network

40 Clients / 26Mbps each
1,040Mbps Aggregate throughput

Design for density

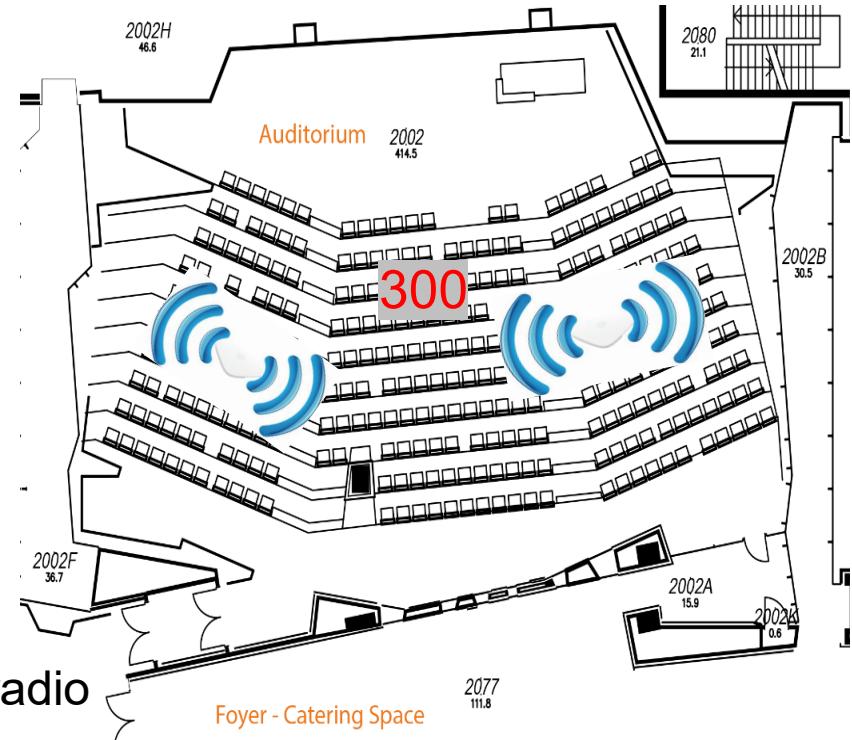

Two XE5-8's

Four 5Ghz radios

Four 6Ghz radios

- 300 Clients = 38 clients per radio

Auditorium Network

300 Clients / 20Mbps

4,800Mbps aggregate bandwidth

Cambium Networks™

Wi-Fi Network
Deployment
Best Practices

Deployment Best Practices

- General Guidelines
- AP Placement
- Education
- Large Meeting Rooms
- Locationing Services
- MDU
- Outdoors / RV Parks
- 2.4GHz vs 5GHz vs 6GHz design impact

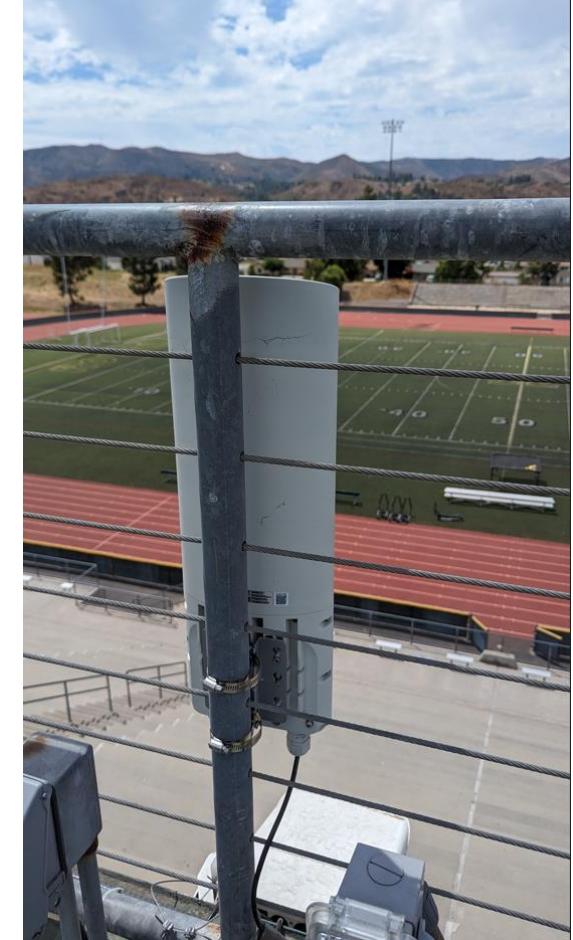

AP Placements – General Guidelines

- Select clean/simple mounting options
 - Balance RF coverage with simplicity of deployment
- Consider cable runs to closet / power for PoE injector if used
- Leverage existing cable pulls if possible
- Omni-directional antenna APs should not be mounted higher than 15ft.
Performance degradation will happen above this threshold
- Directional APs are typically recommended to direct signal to designated areas and avoid co-channel interference.

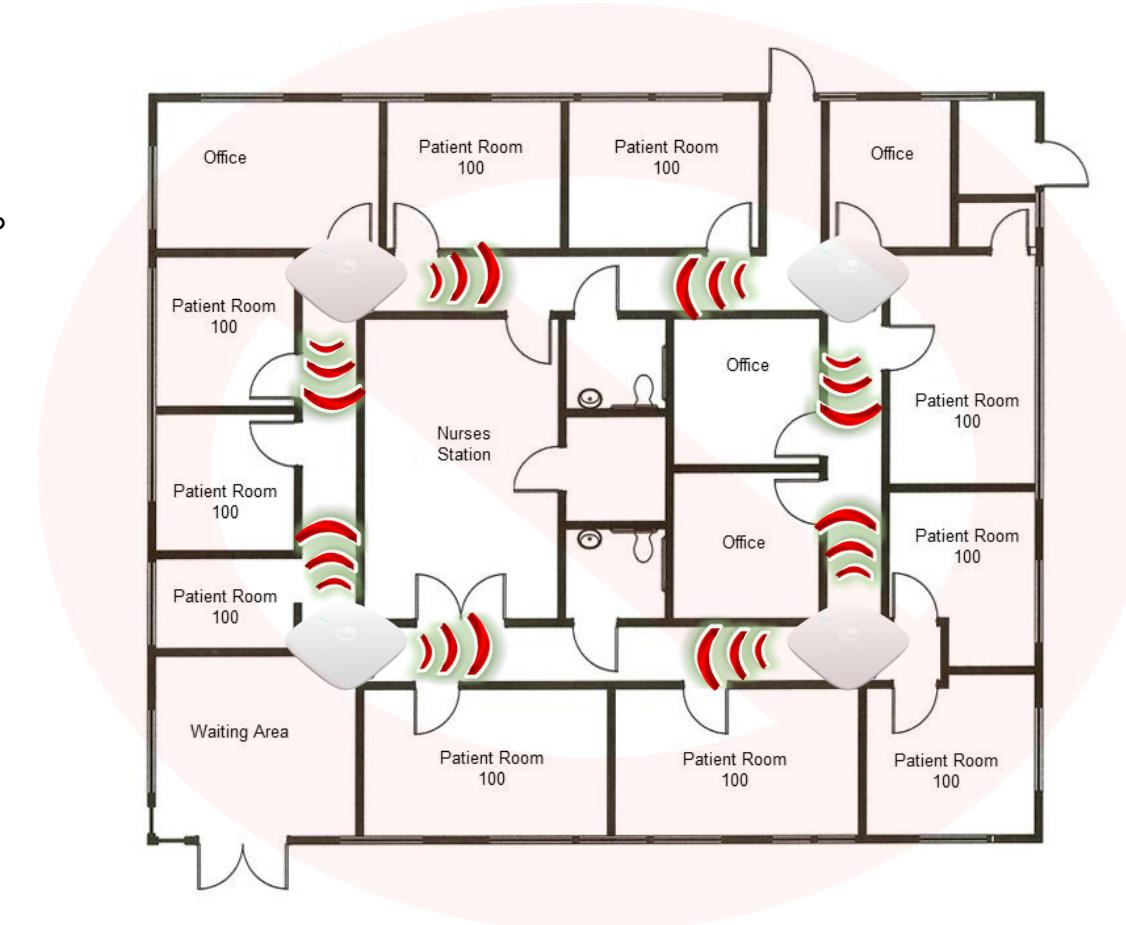

AP Placements

- Ensure the correct degree of tilt to be used, based on height of APs.
- Isolate APs (RF energy) as much as possible.
- Avoid APs having direct line of sight of each other when possible
- Plan for minimum 20-30% overlap in cell overlap

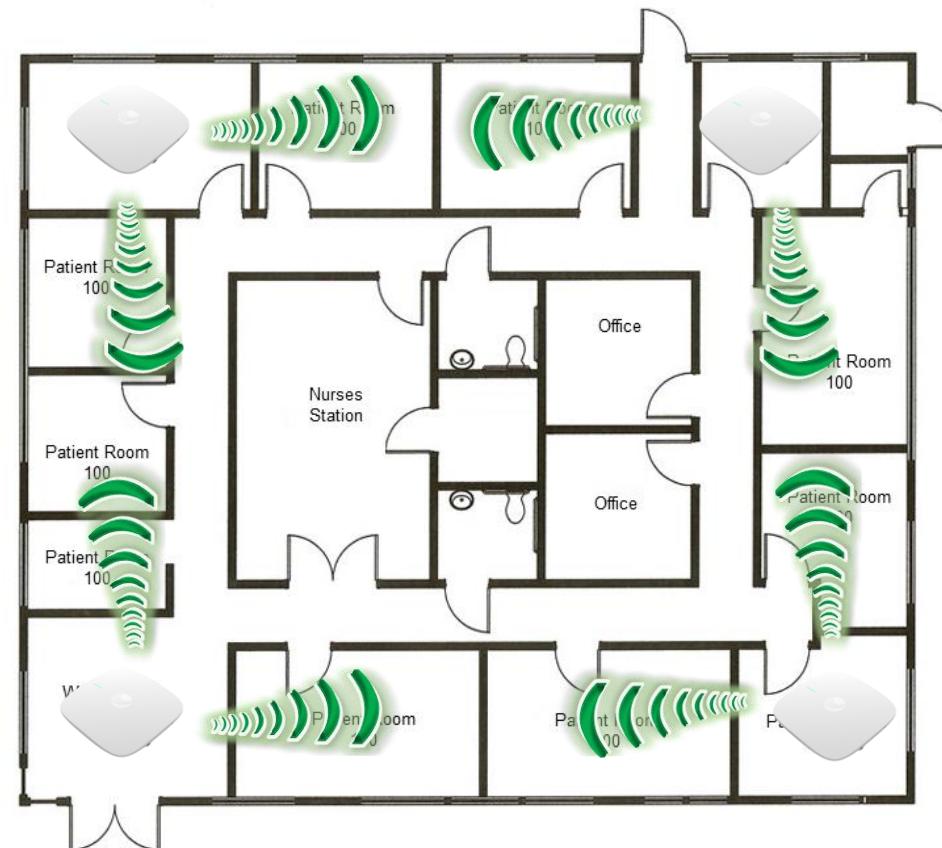

AP placement – Hallway deployment

- Avoid placing APs in hallways and with line of sight of each other
- RF interference, especially in 2.4Ghz band
- RF has harder time penetrating walls at 45° angles
- More prone to multi-path
- More drywall to pass through

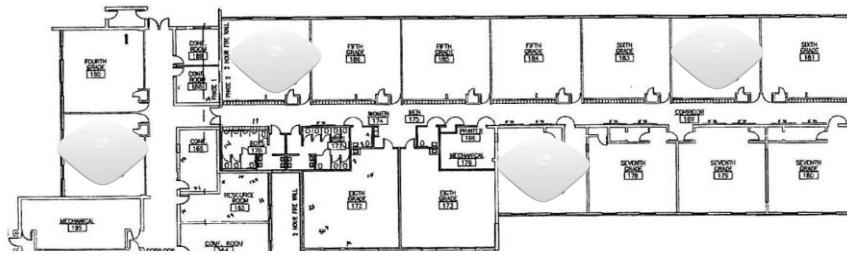

AP placement – In room

- Placing the AP in the room is a better option
- Walls will provide attenuation, and better protection against interference

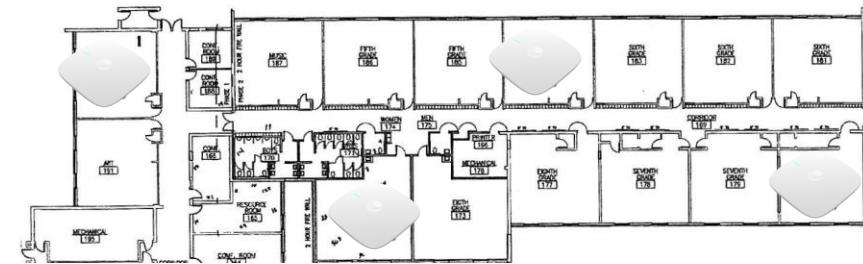

Multi-Level Building Deployment

Stagger APs in adjacent floors

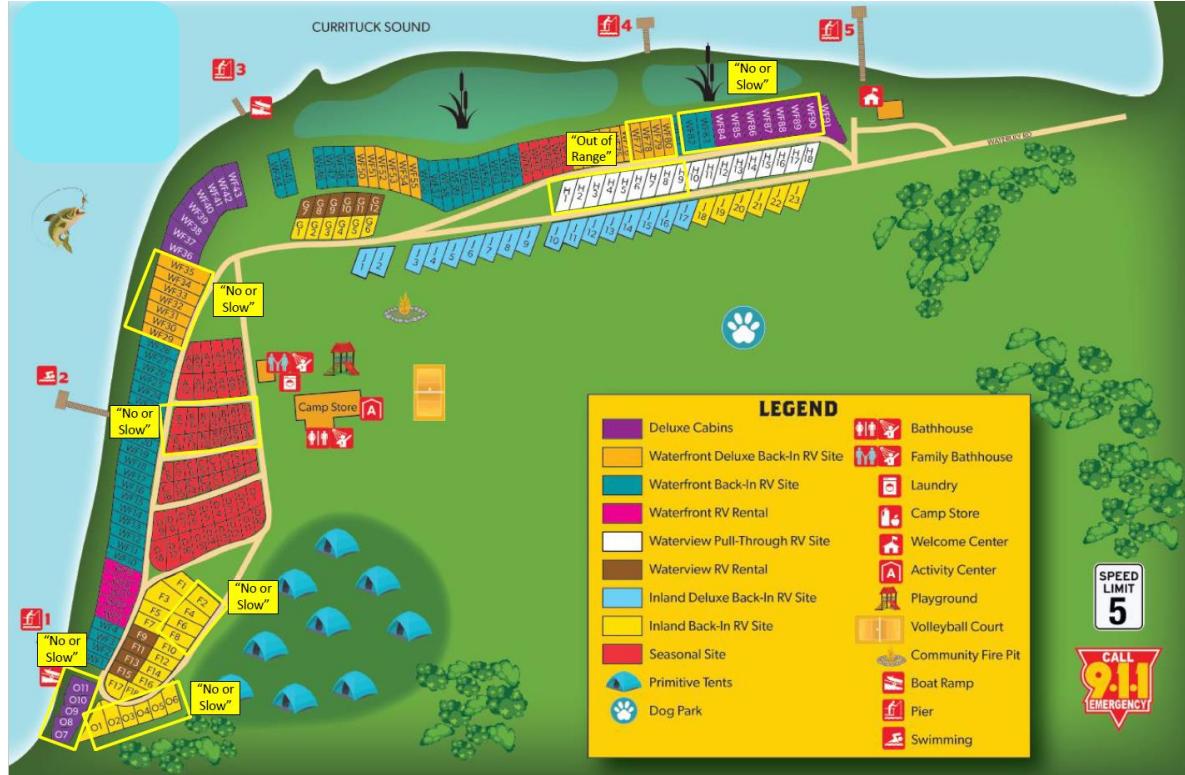

Floor 1

Floor 2

Outdoor Design – Resorts

- Mobile devices include smartphone and tablets. Both low powered devices.
- Network used by guests and staff
- Cabling restrictions, MESH is an option
- Directional antennas are common
- Capacity is generally low to moderate with increasing expectations

Outdoor Design – Antenna Considerations

- AP antenna selection
 - Omni versus Directional
 - Usually comes down to if you need to "target" the signal to specific areas
 - If targeted coverage is required, then directional is usually the choice

Wi-Fi Network Optimization

Cambium Networks™

- Channels
- Channel Plans
- Channel Groups
- Power Settings
- Optimization

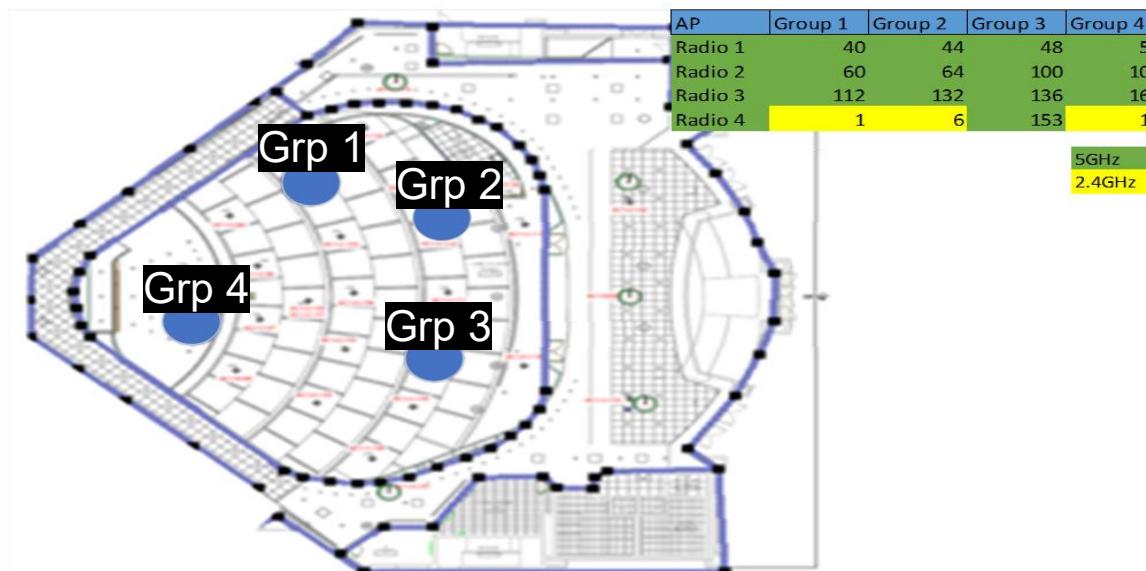

Channel Planning Best Practices

- Careful channel planning is a big factor of ANY Wi-Fi design, especially a high-density network design
- Use Auto-RF when possible, when necessary, use manual channel assignments to avoid ACI & CCI
- Channel reuse patterns may be necessary
- Disabling 2.4GHz radios may be necessary if more than 3 APs are located near each other
- Create as much channel separation as possible (minimum 3 channels, ex. 36 and 48)
- 40Mhz Channels are typical in most environments
- Channel bonding is typically not recommended in high density to minimize co-channel interference and because channel re-use becomes critical

Channel Planning with Channel Groupings

- Channel Plan Groups are used to simplify the process of manually channel planning a wi-fi network where auto-channel is not recommended
- 2 – 5 radios (depending on the AP model), each with a channel assignment
- Channels are selected to create as much separation possible
- 2.4GHz channels should be assigned manually after the 5GHz & 6GHz groups have been assigned

Power Settings Best Practices

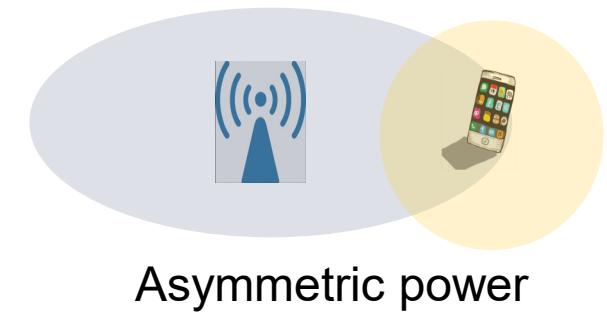

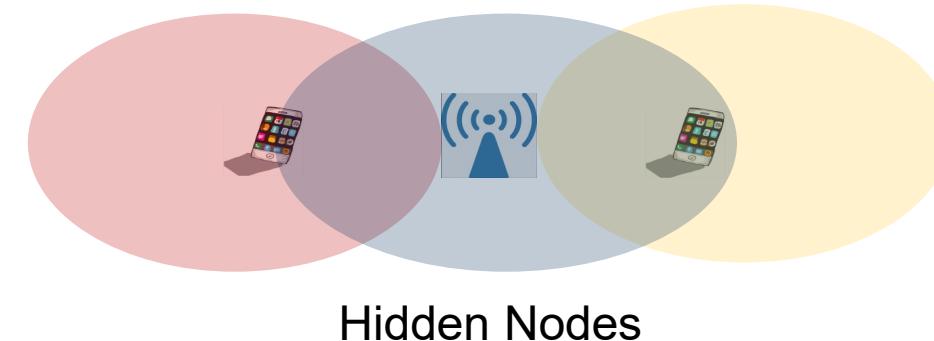

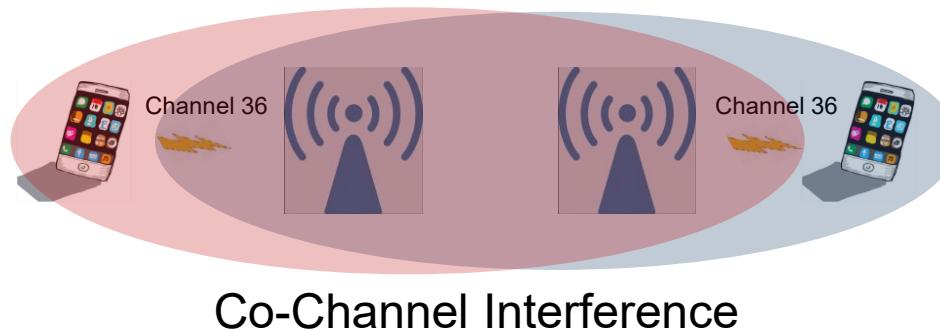

- Critical to the performance of the network
 - Too high – roaming/sticky clients, CCI
 - Too low – poor device performance, coverage area
- Cambium APs are defaulted to “Auto”. This is the highest power allowed for that radio

| Environment | 2.4GHz | 5GHz | 6GHz |
|--|---------------------------------|-------------------|-------------------|
| Classrooms | Small (4-9dBm) | Medium (10-16dBm) | Medium (10-16dBm) |
| Hallways | Medium (10-16dBm) | Large (17-24dBm) | Large (17-24dBm) |
| Enterprise | Small (4-9dBm) | Medium (10-16dBm) | Medium (10-16dBm) |
| Outdoor | Max (25-30dBm) | Max (25-30dBm) | Max (25-30dBm) |
| Auditorium with APs in line of sight Based on # of APs and height of AP. The lower the AP is deployed, the lower the power setting will be. | Preferably Off. Otherwise, 9 | Medium (10-16dBm) | Medium (10-16dBm) |

Power Settings – Too High

- High CCI
- Hidden nodes
- Asymmetric power – Power from AP exceeds power from client device
- Data corruption from smaller device due to distance from AP - common result is invalid password message
- Very large coverage areas
- Sticky clients and odd roaming behavior

Automatic channel selection when booting up

- AP scans surrounding RF environment and selects the cleanest channel available
 - For best results, do this during the day, when network is being used. False readings occur when run off production hours because all channels look clean.
 - Unlikely customer will agree to this due to down time during production hours affecting clients. Therefore, when auto channel is performed during off-peak hours it is not taking into account interferers and attenuation from people throughout the building.
 - Will work for 90% of our customers

Automatic channel selection when booting up

- Trust but verify!
- Run report to verify –
 - cnMaestro - Monitor & Manage > Site > Report > Devices > Type – Enterprise Wi-Fi

When NOT to use Automatic channel selection and use a manual channel plan

- Complex designs require manual channel plans and power/RX settings
 - High-Density environments
 - Dense AP deployments
 - High capacity
